

Implement Client Script & UI Policy (Incident)

Project: ServiceNow Incident Management Optimization | **Phase:** 02 - Requirement Analysis

1. Introduction

This project improves the Incident Form in ServiceNow using Client Scripts and UI Policies. It helps users enter correct information and reduces mistakes.

2. Functional Requirements

The system should:

- Create a new incident.
- Make important fields mandatory.
- Show or hide fields automatically.
- Display messages to the user.
- Validate user input before submission.

3. Non-Functional Requirements

- Easy to use.
- Fast response.
- Secure.
- Reliable.

4. Target Users & Roles

- **Employee:** Creates an incident.
- **IT Support:** Resolves the incident.
- **Administrator:** Configures Client Scripts and UI Policies.

5. System Inputs & Outputs

Input Fields

- Short Description

- Category
- Priority
- Assignment Group

Expected Output

- Correctly validated incident form.
- Incident created successfully with required details.

6. Simple Requirement Flow

Employee → Fill Incident Form → Client Script validates → UI Policy updates fields → Incident Submitted

This is enough for Phase 2. Next, I'll give Phase 3: Project Design with a flowchart, architecture diagram, and UI design that looks good for SmartBridge.
